The Netatmo Smart Radiator Valve gets a new voice control option-- Amazon Alexa, specifically through integration with the Echo speakers and other compatible devices.

Smart Radiator Valves fit on hot-water radiators, and allow customers to control heating on a room-by-room basis. They promise an average 37% decrease in energy used to heat rooms, and Alexa integration provides an additional means for voice control together with the already available Google Assisant and Apple HomeKit.

As a result, one can ask Alexa to change the temperature in a specific room ("Alexa, increase living room temperature"), set a specific temperature ("Alexa, set bathroom temperature to 23 degrees") or ask what temperature the house has ("Alexa, what is the temperature in the baby's room?").
