The flagship Bryston B-100 integrated amplifier gets an upgrade-- the B-135 SST, now able to output 135 watts per channel into 8 ohms with x7 high level inputs.

It handles 300000 MFD of filter capacitance per channel and carries x3 new ultra-low-noise power transformers-- x2 for analog circuits, x1 for digital circuits.

Digital and analog section ground paths are totally separate, and switch, contacts and connectors are gold plated. An RS-232 port allows for remote control via Crestron, AMX and other control systems.

It also has a pass-through feature (for home theatre applications), one tape loop and a pre-out/main-in feature.

Optional additions include onboard DAC and a moving magnet phono stage. Faceplates are available in either 17" or 19" (non-rack mountable) sizes in silver or black.
