Balanced Music Concept (B.M.C.) launches the CS2-- an integrated Load-Effect Free (LEF) amplifier with a built-in option changing it into a stereo power amplifier.

Boosting the CS2 to a stereo power amp simply involves connecting it to a B.M.C. DAC.

The Discrete Intelligent Gain Management (DIGM) system handles lossless volume control by eliminating unnecessary signal attenuation at input and unnecessary high amplification.

The amp outputs 2 channels of 200W into 8 ohms, and 2 channels of 360W into 4 ohms.

A fully regulated power supply with a large 2kW toroidal transformer and energy storage (via specially designed balanced current capacitors) power the amp.
