

Sonos Adds Playback from iDevices

Written by Marco Attard

Sonos customers no longer need PCs in order to take advantage of multi-room audio-- the latest Sonos Controller app update allows for playback of music stored on iDevices.

Available in iPad and iPhone versions, version 3.8.3 of the app plays audio from the devices directly on the system, without need for Airplay turnarounds or docks.

It also handles a number of online music sources, such as Amazon Cloud Player, Spotify, Rhapsody and Last.fm. A familiar drag and drop interface handles playlists.

The app is compatible with Sonos component running on v3.8 firmware, as well as the Sonos Play:3 and Play:5 systems. The company gives no mention of a similar update for Android devices, but we imagine one is in the works.
