

Audica Professional expands its MICROseries audio system capabilities with the launch of the **MULTIZone**

Aimed at retail, bars and restaurants, as well as hotels, museums and other public spaces requiring independent zone input and output control, the MULTIZone is a four-zone control mixer with six music inputs, plus a microphone input for paging. Each of the four outputs can be independently configured to provide music from any one of the inputs plus the paging microphone and the relative levels are set by front panel controls. The music is automatically ducked to allow for announcements to be heard clearly. Up to seven MULTIZone units can be linked for systems of up to 28 zones.

Zone outputs are individually switchable for flat response or Audica loudspeaker EQ, allowing for systems using Audica or any other brand of loudspeaker. A mute control input is provided for connection to fire control systems. This mutes all music inputs while keeping the paging microphone active for safety announcements. Remote zone control is possible via optional in-room wired wall control panels or via an RS232 interface. The RS-232 interface allows control of all basic functions of the unit.

The MULTIZone can be used freestanding, or mounted in its included 19-inch rack-mount panel. Balanced and unbalanced outputs are provided for the MULTIZone to partner with Audica's four-channel MICROplus power amplifier, or any other unit.
