The NuVo multiroom audio range expands at ISE 2014 with the Player Portfolio-- an IP-based system allowing the integration of wired audio distribution in the company's wireless multiroom audio range.

Designed for the custom install market, the Player Portfolio consists of interchangeable wireless (802.11n) and wired (ethernet) players. It is ideal for large whole home applications, with up to 16 separate zones or individual rooms.

The system handles a variety of streamed or networked sources, with Apple or Android devices acting as controller. It is also compatible with a wide range of 3rd party home control and automation systems, with drivers available for Vantage, AMX, BitWise, Control4, Crestron and RTI products.

"The new player makes it easier for installers to satisfy a wider variety of needs and still give their customers all the convenience and flexibility of an all-in-one, amplifier-plus-source solution," the company says. "We've designed our system to handle the highest resolution audio sources of any multi-zone wifi-capable system."
