All-weather loudspeaker maker Terra updates the look and durability of its AC series enclosure models-- now featuring aluminum grilles instead of the moulded resin from previous versions.

The grilles incorporate carefully sized micro-perforations in order to balance attractiveness and speaker protection while having minimal impact on sonic clarity.

According to Terra perforated aluminum is ideal for all-weather speakers, since it does not rust like steel. The company uses a specialized powder coating process for colour matching with the polyethylene enclosure as well as increased durability.

The new-look AC series ships now in black, white and green, with custom colours available on special order.
