AudioControl starts shipping the Bijou 600, a compact integrated zone amplifier with built-in DAC designed to add additional home audio zones and boosting the output of TVs, soundbars and gaming devices.

First seen at ISE 2015, the Bijou 600 features 2 x 100W per channel at 8 ohms, and outputs 200W at 4 ohms. It can also act as a 400W mono-block the company says is stable to 3.6 ohms, and is ideal for improving the audio of TV zones, streaming systems and low impedance speakers.

The built-in Wolfson DAC features a number of bass management features, including subwoofer mono out, AccuBASS equalisation and selectable high- and low-pass crossover.

Installers can hide the compact 1U, half-rack chassis behind thin displays or any additional zone. Further installer-friendly features include switchable inputs (analog, digital coax, digital optical), variable volume control circuitry and control via discrete IR and RS232 commands.

“Our Rialto 400’s success built upon AudioControl’s reputation for producing high-performing compact zone-amplifiers,” the company says. “The Bijou 600 and our entire lineup of performance amplifiers are the next level answer to the question being asked throughout home audio: “Can it look great and sound even greater?””
