Crestron presents the AIR landscape speakers (LS4T and LS6T) and in-ground subwoofer (IGS82T), a product family promising full, rich sound and flexible installation in a range of popular sizes for outdoor applications.

The speakers feature weatherised construction and versatile installation options. Operation is at 8 Ohms with usable frequency range from 80Hz to 20kHz (-10dB), while a built-in transformer allows use with 70 and 100V distributed speaker systems.

Meanwhile the subwoofer carries dual 8-inch low-frequency drivers, 22-120Hz frequency range, 200W power handling, 8 Ohms nominal impedance and built-in 70/100V transformer.

Installers can attach the speakers to a post or wall using wall brackets, or secure them directly to the landscape via included extra-long (45cm) mounting stakes.

"These powerful speakers fill the outdoor space and surround you with audiophile sound as if you were indoors, and they blend in with the landscaping so you can't tell where the music is coming from," the company claims. "The long stakes and optional tether ensure that the speaker stay exactly where you put them."

The AIR landscape speakers are shipping now in a dark bronze textured finish customers can paint to blend with the surrounding landscape or architecture.
