ATC Loudspeakers debuts the Home Theatre Series (HTS)-- essentially a reworking of the passive SCM7, 11 and 40 loudspeakers into a high performance on-wall range aimed at the custom installation market.

Available in 3 sizes and in vertical and horizontal configurations, the HTS systems can generate low-distortion, wideband audio dynamics in virtually any space, from cabins less than 14cm deep. HTS loudspeakers integrate a class-leading drive unit and crossover technologies with a sealed-cabinet design for mounting on or into walls. They are ideal for both movie and music systems.

Key-hole plates on the rear allow on-wall installation, in turn mating with supplied wall fixings. An included card template assists in the marking of fixing positions.

The series consists of the vertically-configured HTS7, HTS11 and HTS40 speakers, and companion HTS7C, HTS11C and HTS40C horizontally-configured versions. All benefit from the proprietary ATC drive unit technology first seen on the SH25-76 dual-suspension tweeters (all models), CLD (Constrained Layer Damping) bass-mid drivers (HTS11), and ATC's 75mm Soft Dome mid-range and 164mm short coil/long gap bass drivers (HTS40).

"In the HTS we've engineered a very discreet, easy-to-install speaker line, which delivers excellent custom design flexibility to residential custom installers, combined with the qualities of neutral fidelity and high dynamic range that our existing hi-fi/audiophile customers will instantly recognise," the company says.
