Klipsch debuts the Reference Dolby Atmos-enabled home theatre speakers-- the only two-way, horn-loaded Atmos-enabled speakers on the market, at least according to the company.

Also included is proprietary Tractrix horn technology, allowing the speakers to meet directivity and sensitivy specifications required for Atmos speakers.

The Atmos-enabled Reference line consists of two models-- the R-26FA and R-14SA. The R-26FA is an all-in-one tower speaker with an integrated height channel able to reflect sound off ceilings to deliver the overhead Atmos experience.

Meanwhile the R-14SA elevation speaker adds the Atmos effect to any existing bookshelf or tower speaker, completing a hemisphere of rich, detailed sound. It can also be used as a side surround speaker for standard surround formats.

Both models feature iconic copper spun Injected Molded Graphite (IMG) woofers that, when combined with the Tractrix horn loaded technology and Linear Travel Suspension (LTS) speakers, produce maximum speaker efficiency.

The R-26FA and R-14SA are available in a black brushed polymer finish.
