Wisdom Audio unveils the SC-2 and SC-3 system controllers at CEDIA 2017--second-generation controllers designed to help solve acoustic problems through calibration tools able to solve audio distortions.

The SC-2 is a 2RU system controller offering 8-channel in to 16-channel out, while the SC-3 is a 3RU platform providing 16-channel in to 32-channel out. Both units operate at 24-bit 96kHz, and provide the necessary digital active crossover and digital EQ profiles for all Wisdom Audio loudspeakers. Another feature is Dirac Live, a platform the company says is optimised for sound enhancement technology.

The two controllers are designed to perfect sound in any listening room by removing resonances and acoustic problems in sound reproduction, creating a natural, realistic and transparent sound with tighter bass. They also reduce early reflections and room coloration without need for room treatments.

An Expert Mode provides installers with an additional layer of fine tuning features, equalisation tools and the ability to override delays and trim EQ to optimise system performance in the most difficult acoustic scenarios. Four preset slots store up to four complete and independent calibrations, meaning installers have room for multiple room correction setups for up to 16 zones or rooms.
