Vincent Audio launches the SV-200 hybrid integrated amplifier-- a "little brother" to the SV-237MK and the SV-700 featuring two 6N1 vacuum tubes in the input stage complementing digital inputs and built-in DAC.

According to the company, the hybrid design offers the rich audio associated with vacuum tubes while providing the power and control of solid-state electronics. The DAC handles the latest high-resolution streaming formats, including WAV, FLAC, AIFF and APE, among others, while the power supply features Elco capacitors for buffering to keep the electric current clean and noise-free.

Inputs include x2 analog and x2 digital (x1 optical, x1 coax). A recorder output and preamp output allow customers to connect the SV-200 to a recording device and a power amp or subwoofer. In total the SV-200 measures 210 x 95 x 320mm, making it compact solution for customers demanding a high-performance integrated amplifier.

The SV-200 is shipping now in either black or white.
