Connecting the iPod to a home theater receiver has just gotten easier with Yamaha's new range of AV receivers.

These high-end home theatre receivers introduce new technologies and functions. For example, the RX-V3800 includes 3D CINEMA DSP, latest HDMI 1.3a specification support, upscaling to 1080p, full support for high definition audio formats signals, Adaptive DRC and Adaptive DSP Level, and Network Receiver functions. It features 7-channel surround sound: 980W=140W x 7 RMS; 200W x 7 Max (for Europe).

The new receivers offer flexible configurations, automatic system calibration, advanced video capabilities and now satellite radio plus iPod compatibility.
