Ingeny, the home automation division of security systems and building technology integrator Interphone, launches a cinema room solution for the residential sector designed for the conversion of under-utilised or redundant spaces.

Ideal for both existing and new residential developments, the solution promises to enhance communal areas within a building and provide an improved living experience to residents. It includes all building works, soundproofing, decoration, wiring, lighting control and AV installation, as based on an appropriate plan from an in-house design team.

Also involved are custom joinery and furniture makers for seating of either the bespoke or retractable variety.

“Property managers and developers are increasingly looking at ways of differentiating existing and new commercial residential buildings to boost appeal and demonstrate value to residents,” the company says. “In recent years, many prestigious apartment complexes have been looking to provide lifestyle facilities that offer a five-star experience, with a cinema or private screening room becoming one of the most in-demand features, so we have created an offering that makes this kind of option accessible to more buildings in the marketplace.”
