StormAudio is the next member of the Cinema Designer program, allowing dealers enrolled in the program to design and present theatre and media room layouts in a professional yet easy to create manner.

The Cinema Designer is a cloud-based design tool with a large database of products from participating CI vendors. Installers can calculate and produce 3D CAD drawings, specify the precise location of loudspeakers, screen, seating, projector, crucial amplification and processor requirements, acoustic treatments, RT60 value and more. The tool a generates detailed documents complete with audio and video calibration reports, as well as true-to-room aesthetic renders reflecting how the finished room will look.

"The StormAudio audio processors and amplifiers can drive up 32-channel theaters and now we have integrated native 9.1.6 Dolby Atmos processing across the line," StormAudio says. "As audio system configurations become more complex to achieve such new heights in surround sound entertainment, a tool like The Cinema Designer is particularly useful for integrators."

Installers must become a Cinema Designer dealer in order to use the program.
