Infocomm 2011 hosts Peerless-AV's HDS100 HD Flow wireless multimedia kit-- an 802.11n transmitter and receiver system the company says streams AV signals to displays up to 131' away.

It uses long-range 1080p 60Hz wireless media streaming to provide real-time HD transmission through walls, floors and ceilings with minimal latency.

Peerless-AV says the system comes at half the cost of similar systems, while having a smaller footprint, wider IR frequency interoperability and more connectivity options.

It can handle up to x4 source devices, with easy switching between sources via remote control unit or pushbutton on the transmitter-- with the option to switch to a second wifi channel in case of interference, with plug-and-play operation.

The package includes transmitter and receiver (with base stands), remote control, component-to-VGA adapter, IR Blaster cable (with x3 emitter) and x2 power adapters.
