

New Way to Fold Up the Home Cinema Screen

Written by Bob Snyder

From France, country of the tricolore, comes another "tri-ple" idea: the DesignScreenHD screen folds in 3 parts.

As simple as closing a window: you close the left section, then the right, and the last visible panel can be an authentic picture frame on the facade.

With this patented mechanism, the screen surface gently folds and curves within the frame structure to provide a fully tensioned home cinema screen that takes up only a third of the living room wall space.

DesignScreenHD projection screens are equipped with a HD quality screen surface that has a reflective top coating, without directionality. The screens are fully tensioned (strung every 6cm or so) on aluminium fixed frames and give the experience of a dedicated theater room in the living room.
