

CEDIA releases the 2nd white paper on the integration of mobile devices in residential systems-- Ten Steps to Creating a Robust Wireless Environment for Mobile Device Integration.

As customers depend more on IP networks and mobile device numbers grow, modern homes need increasing amounts of wireless bandwidth in order to keep all devices working and communicating at all times.

Thus the white paper provides installers with a 10-step roadmap to creating a profitable and repeatable wifi solution.

The paper combines with the advanced IP and networking courses the association offers at CEDIA EXPO, and is available from the CEDIA marketplace.
