adds
Wide Band (UWB)

To be demonstrated at CEDIA 2010, Atlona Technologies
a wireless KVM extender for PCs using Ultra
to extend DVI signal, along with
USB, and stereo audio up to 30 feet away at resolutions up to 1440x1050.

This wireless KVM Extender is designed as a solution for those looking to wirelessly use their computer in a separate part of a room and for netbook users who want a larger keyboard and screen for day-to-day tasks.

The PC Link has the ability to transmit to up to 4 receiver modules, extend desktop images from a laptop to a larger monitor, and mirror a desired display onto a second monitor.

This new Wireless KVM Extender solution allows PC users to connect to a monitor, keyboard, mouse and speakers, via a single wireless link with a single adapter that connects to a USB port.
