

Middle Atlantic Boosts EU Support

Written by Marco Attard
10. 12. 2019

Middle Atlantic commits to offering more solutions and support in the EU with both local inventory and shipments of region-specific power plugs for the High Power DC Power Distribution series.

First seen back at ISE 2019, the high-power capacity solution promises maximum power to support more devices. It also eliminates messy, space-consuming power supply units (aka wall warts) from AV design. Available in 200 and 300W models, both units offer high current capacity to an industry-leading quantity of outputs-- up to 24 devices-- in a 5, 12, 24 or 12/24V split unit. EU customers can select models with appropriate power plugs, be it BS 1363 (UK), CEE 7/7 (Schuko), SEV 1011 (Switzerland) or IEC C14 for fast and simple ordering.

“Since we introduced our family of High Power DC Power Distribution options last year, the demand and customer requests in the E.U. have been amazing,” EMEA distributor Legrand |

Middle Atlantic Boosts EU Support

AV says. “Now, all of our EU-specific DC Power Distribution models are available from our warehouse in Weert, Netherlands. With this product inventory availability, integrators in the region can complete installations with much shorter lead times. This is all part of ensuring our customers can solve today’s AV challenges not only efficiently and quickly but also with maximum reliability.”

The power solutions also include multilevel protection on both AC input and DC outputs with built-in individual redundancy to ensure maximum reliability. Customers can install the multimount design in either a 1RU space or at the back or side of the rack for zero-U mounting. Input voltage range of 100-240VAC, 50/60Hz provides design flexibility for most global applications.
