

Get your customers the 4TB Western Digital ShareSpace: they can load it up with video, audio, application installations files, drivers -- anything they're going to need from the PCs across a home network. If you just have a 2 or 3 node network, routers have USB ports to connect a drive like this and create a Home NAS for less.

This high-speed Gigabit Ethernet storage system can handle a small office plus a home network (a common configuration today), giving centralized storage with plenty of capacity to go around.

The box measures about 7.7 inches high by 8 inches long and 6 inches wide. "Green" drives inside run cool by using nearly 40% less power than a standard HDD.

Installation is simple: run the included CD. Accessing the ShareSpace and its options from a browser is via icons that guide you through the tasks.
