Bitdefender updates the Box online security device with Vulnerability Assessment and Active Threat Control, allowing to further protect all connected devices.

Vulnerability Assessment identifies security weak links to bolster defenses against data theft, malicious attacks and other intrusions. Meanwhile Active Threat Control monitors processes and system events via machine learning and behaviour-based threat analysis to identify malware.

Customers can access the Vulnerability Assessment by opening the companion Box mobile device app and pressing the Vulnerable Devices button. The service proceeds to scan the network and identify all vulnerabilities.

"For years, traditional security solutions have been fighting an uphill battle against online criminals," Bitdefender says. "With the help of the latest innovations in online security, the BOX changes that-- it positions you, the users, at the top of the hill, giving you a permanent strategic advantage. It will give you the intelligence you need to strengthen your weak points, and even malware that has not yet been invented will not make it past your guard."

The Box update is available for download now.
