

Savant Intros 4K over IP Switching

Written by Marco Attard
08. 02. 2017

Savant announces an "ultra-high-performance" 4K video over IP switching platform-- one giving installers a "distinct advantage" in the delivery of premium AV content to both residential and commercial clients.

The new product line delivers 4K/60 4:4:4 HDR video distribution over IP, with zero frame latency and the convenience of a centralised 10GbE switch. The chassis is designed for ease of installation, while audio down-mixing capabilities and audio breakout options make it an ideal match with the recently released Savant Pro Audio 4 IP-based switch with unlimited audio zone support and access to all popular streaming services.

The switch is scalable from 2 to 128 zones, and support for advanced video processing features includes multi-video/video tiling, video wall and multi-switching applications.

“In prior ventures with Excel Switching, we led the telecom industry’s evolution to IP-based switching systems-- today Savant is leading a similar evolution in video switching,” the company says. “These new best-in-class 4K switching solutions deliver the same advantages to the A/V integration professional within a complete suite of products that give them a competitive advantage in the luxury home and commercial markets.”

The Savant 4K video over IP switching solution is on show at ISE 2017 before shipping on Q3 2017.
