Ihiji presents an sequel to the APP-500 network management appliance-- the APP-750, featuring an upgraded chipset and a network bus able to more accurately test modern IP speeds up to 1Gbps.

The Remote Systems Management (RSM) solution can be paired with either of the recently announced Ihiji Invision licensing plans. The Ihiji Invision Lite license allows installers to monitor ISP uptime and speeds, and enables remote reboots of IP-based PDUs, UPS and Managed PoE at any job site, with no monthly increase in the monthly Ihiji subscription price.

According to the company, the enabling of Ihiji Invision power management functionality and ISP monitoring at no extra cost should make it easier for installers of all sizes to take advantage of the Invision platform. The Lite plan also allows installers to standardise one remote management platform for all reboots, network monitoring and systems troubleshooting.

One can also activate the APP-750 under the Ihiji Invision Standard service level to enable the platform's suite of proactive monitoring and network diagnostic tools.
