Luxul announces the ISE 2018 debut of the Epic 3 (XWR-3150)-- a dual-band wireless AC3100 router with built-in Domotz remote management, Router Limits content management and roam assist technologies.

The Epic 3 uses 4x4 MIMO (Wave 2) technology to deliver wireless data at up to 3100Mbps for fast streaming and bandwidth-intensive applications. The router offers a full feature set, with an easy-to-use interface and capabilities ensuring optimal network performance, scalability and security, including firewall, QoS, virtual local area network (VLAN) support and virtual private network (VPN).

Installers can use the integrated Domotz technology to remotely manage and support customer networks and all connected devices. The system pushes alerts in case of network issues, allowing one to take immediate action. Router Limits content management allows users to manage internet traffic, choose which device can access the web, determine what parts of the web are OK (or not) and set days and times the internet is available.

A built-in wireless controller featuring Roam Assist technology makes it easier for installers to set up more than one access point in larger wifi networks, while ensuring a seamless roaming experience for customers.

Another ISE 2018 debut involves the Luxul XAP-810-- an AC1200 2x2 dual-band wireless access point (WAP) featuring 5GHz beamforming to deliver data rates up to 1200Mbps and excellent wireless coverage. A sleek design makes the WAP ideal for mounting on ceilings, walls or other flat surfaces, and installation requires a single ethernet cable to deliver both power and data via integrated PoE+ port.
