URC announces 2-way control modules (drivers) extending integration of Total Control whole-house home automation to 2 multi-room audio sources-- Denon HEOS and CasaTunes.

The HEOS control module enables browse and play of HEOS-supported music services, and allows users to manage HEOS player queues, manage player grouping, observe now playing status with metadata and provide 2-way control of all transport controls, volume/mute, queue control and playlist control.

Meanwhile the CasaTunes module allows users to browse, search for artist, album or song across all services and provides the ability to send multiple music streams from iDevices to CasaTunes. It also features triggering macros with device events.

Both modules are developed in-house, and URC already provides drivers for the integration 3rd party products from the likes of Lutron, SONOS, Honeywell, Aqua-Link and Lilin with Total Control whole-house home automation.
