The consumer segment of Crestron's ISE 2017 booth was all about voice control, as the company took to highlight its partnership with Amazon with live demos in a dedicated soundproof room.

As the company puts it, Crestron Technology Professionals can leverage the Alexa Voice Service to build voice-controlled scenes and settings based on customer specifications. Integration is not limited to just lighting and temperature control, as homeowners can choose from an "unlimited" range of voice control options.

"We've been collaborating very closely with Amazon Alexa engineers to make sure we offer an uncompromising voice control experience that is every bit as seamless and satisfying as tapping a button on a beautiful Crestron touch screen, remote control, or designer keypad," Crestron says. "You can ask Alexa to set the mood for dinner, or to play a movie in the bedroom, or let her know it's too cold in the bathroom. Just say the word and your Crestron system responds immediately."

Installers define and deploy Amazon Alexa skills through new software modules interfacing with both the Smart Home Skill API and the Amazon Skill SDK. These are compatible with both Crestron 3-Series processors and Pyng home automation systems.
