

Home automation and control device vendor Fibaro announces integration with Russound with trio of plug-ins allowing Fibaro Home Center controllers to manage Russound audio systems.

The plug-ins in question provide control for the Russound XSource audio streamer, MCA-88X multi-zone controller amplifier streamer and the XZone4 four-zone audio system. As a result Fibaro and Russound dealers can promote the systems with the Fibaro Home Center controller, providing customers with a pro-grade audio solution for smart homes.

The plugins allow customers to control basic functionality via the Fibaro app, including zone power, play/pause, volume level, mute/unmute, previous and next, as well as select favourite radio stations and audio queue setup in the My Russound app. One can access the plugins within Home Center 2.

“We are always working on improving our controllers with new integrations that expand features while making it easy to manage all components within one system,” Fibaro says. “From a custom installer’s perspective, Russound meets a very high audio standard. Whether it’s a single room setup or multiroom configuration, Russound’s integration is a seamless and reliable option while remaining cost-effective.”
