Samsung combines networking and home automation with the Connect Home Smart Wifi System-- a router packing the Samsung SmartThings platform, eliminating the need for a separate control hub device.

The Connect Home uses Eero-style mesh networking, meaning a single router provides up to 140 square metres of coverage while a combination of three routers covers 418 square metres. In addition, the SmartThings platform allows it to communicate with other devices via Bluetooth 4.1, ZigBee or Z-Wave as well as wifi, providing the control Samsung appliances, Philips Hue lighting and Netgear Arlo cameras, among others.

The system is expandable to up to 5 Connect Home routers, and Samsung promises security comes through both hardware and automatic firmware updates. Setup should be easy via companion Samsung Connect app complete with simplified device management through automatic connectivity and device integration, as well as connected device management, parental controls and guest access.

“Today’s smart homes have the power to deliver simple and efficient automation, but as families stream more content and buy more connected devices, it’s a struggle to get fast, reliable and extendable wifi coverage,” the company says. “With Samsung Connect Home, we’re redefining the whole home network to finally offer families a simple solution that expands wifi coverage throughout the home while offering the ability to monitor, automate and control smart devices using Samsung SmartThings.”
