---

Control4 shows off its latest wireless controller at ISE 2018-- the CA-1, a means for installers to provide customers with a start in home automation through lighting, temperature, control and security control.

The CA-1 features ethernet, wifi, ZigBee and serial connectivity, and leverages on the Control4 database of thousands of 3rd party devices. An optional Z-Wave module adds compatibility with Z-Wave-enabled devices such as door, window, water, flood and temperature sensors, as well as electrical outlets and dimmer outlet modules. Power over Ethernet (PoE) allows installation anywhere with a single network cable.

“The emerging range of smart locks, thermostats, lights, and cameras available today have certainly raised consumer awareness for the promise of the smart connected home,” Control4 says. “Homeowners as well as home builders and building developers are looking for more than a just collection of independent smart devices. Our new CA-1 and industry-leading Control4 OS delivers that needed capability and customer experience – orchestrating all of the smart devices in a home.”

The CA-1 is available now.
