

Power Management Takes to the Cloud

Written by Marco Attard

People Power announces its Energy Services Platform (ESP), an open, scalable energy management cloud-based service.

Designed for device manufacturers, it enables energy usage control and monitoring. It provides OEMs with an "energy control" layer to build into products, from business devices to CE.

ESP works with OSIAN (with incorporated People Power SuRF module), wifi or Zigbee-enabled devices.

The technology scales up to support "Internet of Things" traffic requirements, while providing real-time energy monitoring and control down to plug level.

A number of leading companies work with People Power-- including Ricoh Innovations, Texas Instruments and D-Link.
