URC gets further capabilities with the launch of a two-way IP module for Total Control of the Pentair IntelliTouch pool and spa control system.

The module allows customers using any URC Total Control interface to control all Pentair Pool & Spa products compatible with the IntelliTouch system, including pool pumps, cleaners, heaters, pool lights and water features. The integration requires a Pentair i-Link home automation protocol interface adapter. Installers can program macros with device events, status queries or set modes (such as "Party Mode" or "Romance Mode") using either URC Accelerator or TC Flex programming software, with activation using a URC Total Control 2.0 controller.

“We are excited to include Pentair pool and spa systems in our portfolio of Total Control modules, as they’re the world leader in innovative and high-performance swimming pool and spa equipment,” URC says. “Now URC dealers can easily empower their homeowners using any URC Total Control touch screen, handheld remote, keypad or smartphone/tablet using URC’s Total Control app to set and control the temperature of their pool and/or spa, turn the lights on or off, set and change the brightness and color of the lights, activate their filtration system and pool cleaners, and even turn on or off outdoor waterfall pumps from inside or outside their home.”
