

Niko proposes a new energy management and automation system at ISE 2011-- monitoring electricity, gas and water consumption while controlling heating, cooling and ventilation.

Through its touch screen interface users can view their home (or single room) powering costs, as well as check their home's entire energy consumption history and carbon footprint.

The company believes energy usage monitoring can save a home up to 15% in power costs.

This future product is currently in production and should be available by August 2011.
