

An Eve to Supervise

Written by Marco Attard

Ilevia launches what it says is building automation's fastest building automation system-- EVE, a system working with components from most manufacturers through most mobile and tablet devices.

To ensure maximum speed, the EVE system does not require connection with a web server. Instead, it communicates in each connected device's specific language. Communication languages include EIB/KNX, Vimar, Bticino and ModBus, amongst others, covering all under a single UI.

The device itself is also small and energy efficient, needing less than 200 mA to operate.

While it comes with its own dedicated remote control, Ilevia also supplies apps for all major PC and smartphone operating systems-- Symbian, Windows Mobile/CE, iDevices and Palm, as well as Mac OS and Windows.
