---

The Autonomic Mirage Media Server (MMS) platform is the first to fully support the Crestron media player application-- providing installers native interactivity with Crestron processors and touchscreens.

Crestron Smart Graphics and SmartObjects allow the creation of gesture-driven controls, animated feedback, metadata, embedded apps and full-motion video for one interface, with automatic scaling for all Crestron interfaces.

Meanwhile MMS products can deliver content and controls as native Crestron ecosystem components, with iTunes, Spotify, Pandory, Rhapsody, Last.fm, TuneIn Radio and Sirius XM streams appearing on Crestron touchscreens and iOS devices without need for too much installer effort.

The application is available for all Smart Graphics-enabled interfaces, including TSW high-resolution touchscreens.
