

Amber Intros URC Total Control Additions

Written by Marco Attard
18. 06. 2013

Amber International ships several additions to the URC Total Control product line-- including the TKP-7000 touchscreen, CAM-DC1 surveillance camera and the THS-WD1 external temperature sensor.

Custom installers also get "Offsite Programming" allowing remote access to MRX-10 advanced network controllers. Installers can program/reprogram, change cable channel line-up, reset favourites or make any other adjustments without need to visit the installation site.

One can access the controller from anywhere equipped with an internet connection.

The TKP-700 is a 7-inch capacitive touchscreen. It handles 1024x600 resolution and adds entertainment, lighting, heating and security control, with full graphic feedback from URC and compatible 3rd party devices.

It also displays live video from URC cameras such as the CAM-DC1-- a compact and easy-to-install unit available as either an indoor mini-dome or vandal-proof outdoor dome camera.

Features include H.264/MJPEG compression, motion detection, web-based setup/administration. Control comes via 32-bit embedded Linux CPU.

Amber Intros URC Total Control Additions

The THS-WD1 is an external temperature sensor designed for use with the URC THZ-100 thermostat. It allows for an additional temperature measurement zone away from the unit itself, and allows customers to easily observe temperature-sensitive areas.
