Simple.TV launches the second generation of the DVR sharing its name with hardware from network-attached tuner maker Silicondust, as well as a 2.0 update for the software powering the first generation DVRs.

The upgraded Simple.TV is a dual-tuner number promising an upgraded chipset and higher-sensitivty tuners. A USB port allows local storage connection, and like the first-gen DVR it both records and streams TV video to multiple devices.

Meanwhile the software update promises a more streamline interface, account management tools and performance improvements, as well as features such as the ability to download TV shows for offline playback.

Mobile device users also get updates for iOS Simple.TV app and a new native Android app.

The Simple.TV DVR is available now.
