Crestron unveils its latest wireless innovation in touchpanel technology for the very first time in the UK at CEDIA 2008. This exciting addition to the Crestron product range will be showcased exclusively on stand B8, alongside the TPMC-8X WiFi touchpanel and the TPS 4L. Crestron's lighting control solutions for the European market will also be featured on the stand, along with the company's European CAMEO Keypads and the award-winning Adanto AMS-AIP.

With its stylish and compact design the TPMC-8X WiFi touchpanel allows users to access internet as well as control all systems, including lighting, heating, security, blinds/curtains and much more, all at the touch of a button. It communicates via 802.11a/b/g and integrates technologies including Windows XP and PC applications, biometric fingerprint scanner, NetMeeting, Skype, Bluetooth and others.

Also on show will be the award-winning AMS-AIP. Able to scale video input signals to match the resolution of a high-definition display, it can also support output resolutions up to 1080p with a choice of component, HDMI, DVI, or RGB connectivity. It can also display multiple screens of varying and scalable sizes allows the AMS-AIP to create the ultimate "picture-in-picture" function. As well as allowing the viewer to display, for example, security camera feeds, it can also display a touchpanel layout.

Another highlight will be the company's European CAMEO keypads, featuring responsive user control and new design. CAMEO design features new finishes, rounded buttons with enhanced tactile action, and backlit laser-engraving for easy-to-read text under any lighting condition.
