Crestron announces the TSCW-730 Touchscreen Control System-- a complete space-saving control system in a single wall mount device designed for applications with limited space available.

According to the company the touchscreen is ideal for conference rooms and hotel venues, as well as residential applications where traditional equipment racking is not possible.

It sports AV device integration together with climate control, security and the like, with the built-in 3-Series control system featuring both ethernet and Cresnet ports for easy expansion via C2N-IO Control Port Expansion Module.

"Using the TSCW-730 you don't need to homerun control cables back to a central rack," Crestron says. "Better still, you don't need a rack or additional furniture to house the control system. Installations don't get any cleaner than that."

The 7-inch capacitive display uses Crestron Smart Graphics and supports H.264 video streams. On-board Rava SIP technology also allows use as an intercom or phone.

The TSCW-730 ships with a set of 10 optional dual-colour (green, red) backlit pushbuttons. For installation on tabletops or surfaces Crestron also offers optional mounting kits.
