Fusion Research announces the releases of a new driver for its Ovation products-- one taking advantage of the new Listen features available in Control4 OS 2.6 software.

The driver includes the placement of streaming apps directly in the "Listen" page of a Control4 system, as well as further functionality such as the addition of search, favorites (stations, playlists, etc) and Pandora thumbs/down options to further enhance the homogenous look and feel of the integrated visual music interface.

"Our engineers worked closely with the Control4 Listen & Watch team from the very early days of development on the new Control4 Listen experience," Fusion Research says. "This direct involvement led to not only improved functionality for the Fusion driver, but additions and improvements to the overall experience."

The new driver is available now. It is compatible with the current Ovation product line, and is pending final Control4 certification.
