Extron launches 10-inch versions of its control system touchpanels with the TLP Pro 1022M and 1022T-- wall mount and tabletop models featuring capacitive edge-to-edge glass touchscreens.

The displays handle 1024 x 600 resolution and, like all TouchLink Pro models, feature faster processing and more memory within a sleek design. Power over Ethernet (PoE) provides power and communications over a single ethernet cable.

The touchpanels work together with any Extron IP Link Pro control processor for use in AV system applications requiring complete control of a broad range of devices. All TouchLink Pro models use standard network infrastructure, and are customisable using Extron GUI Designer software.

For mounting flexibility installers can remove the base of the TLP Pro 1022T for mounting on any VESA standard mounting arm or bracket.
