With Autonomic Controls, users can integrate Pandora to create and play their own Internet radio stations within a whole-house entertainment system.

Your customer can use an AMX touchscreen (or another home control) to "build" an Internet radio station based on an affinity towards an artist or group.

Pandora interface is part of Autonomic's entertainment platform, so users customize radio stations. The customer can "Wake Up" with lights on in the master bathroom and listen as his customized Pandora station draws down tunes from Dylan's "Desire" album. Autonomic software lets users build Pandora radio stations based on anything with metadata.

In other Autonomic news at EHX, the company is launching its first hardware product, the ACMS (Autonomic Commercial Media Server). The ACMS features 7.1 audio and 12 additional music zones. Loaded with Autonomic's MCS media management software and a few additional features, it offers options for scheduling media as well system-wide synchronization.

"You can have master and slaves," says Autonomic's Michael Toscano. "You can put one in each hotel and just program one of them. They all sync up."
