RTI announces the availability of the KX10-- an in-wall touchpanel combining the capabilities of a control device and a large HD display in a single powerful interface.

The KX10 features a 10.1-inch 1280x800 WXGA resolution display, and is programmable to the finest detail using RTI's Integration Designer software. Connectivity to local devices comes through IR and RS-232, while further features include built-in intercom support, proximity sensors and an ambient light sensor.

Wifi connectivity allows easy use in retrofit installation, while wired 10/100 Base-T ethernet includes Power-over-Ethernet (PoE) Plus.

"The advanced engineering of our new KX10 in-wall touchpanel makes it much more than just a control device," the company says. "With its large, high-resolution LCD, users also have a convenient place for viewing HD video via the unit's HDBaseT input as well as analog video sources through the composite input port."
