DemoPad announces a smaller version of the Centro-8 control processor-- the Centro-8M, a device small enough to fit behind a wall-mounted TV ideal for smaller installations or single room projects.

It features 3 IR emitter ports and 1 receivers, and acts as an IP gateway for the sending of IR commands. An optional RS232 to USB cable adapter adds more system control, while the same Linux server software found in the bigger Centro-8 allows for macro commands. The result provides customers with means to control just about anything, from smart lighting to AV systems, through familiar remote controllers.

DemoPad says it has also developed Amazon Echo skill support for voice control of connected devices, and an upcoming firmware update should add IFTTT support.
