Pro Control starts shipping its Z-Wave solutions-- including the Pro.zwi Z-Wave interface module, a means for what the company says is simple control and monitoring of Z-Wave enabled systems and devices via Pro Control system.

The Pro.zwi module provides the communication interface between a Pro Control system and Z-wave wireless lighting control devices, residential door locks, thermostats and other devices. Programming capabilities enable the need for a different need for each Z-Wave device, providing unified control and monitoring over all systems without Z-Wave licensing or monitoring fees.

The solutions line is ideal for both new construction and retrofit installations, and includes switches and modules enabling users to manage lighting elements both locally and from a Pro Control user interface. All can be installed without need for new or specialised wiring. For example, the battery-operated "Anyplace" switch eliminates the need for wiring, offering flexible installation possibilities.
