RTI announces a two-way driver adding control capabilities for the Revox Multiuser System through the RTI lineup of handheld remotes, touchpanel controllers and the RTIPanel app for mobile devices.

The Revox Multiuser System gives users access to numerous internet radio and streaming services, and allows them to incorporate music servers, CD players and TVs as sources. The system is built on a user-centric operating concept, meaning users simply need to select their name and the system starts playing already-specified favourites at a defined volume level.

The experience continues throughout the home, with users confirming their name from room to room. The system plays fully synchronised and in true studio sound quality. The two-way driver incorporates RTI handheld remotes to the Multiuser System, allowing users to browse favourites and adjust audio sources through the touchscreen and control frequently used functions using the soft-touch buttons.
