URC launches a two-way IP module allowing installers to integrate the Total Control system with the Lutron QSX HomeWorks processors, specifically the recently available HQP7-1 and HQP7-2 processors.

"This two-way IP module, developed natively by URC engineers in collaboration with Lutron, provides easy control of Lutron's HomeWorks system and allows dealers to mix and match Lutron's QS Wired and Wireless lighting systems for control from any URC Total Control user interface," URC says. "Better yet, it is easy for Total Control dealers to integrate since Total Control will pull in the programming from the Lutron system into the Total Control program."

The integration of the Lutron QSX processor and URC Total Control system allows installers to combine a Lutron Radio RA2 and RA2 Select into a single interface on a URC Total Control touchscreen, with all room and zone names populated with data received from the LEAP protocol. The Total Control 2.0 system features premium performance, customisable GUIs and robust 3rd party integration, and is ideal for both residential and commercial applications.

URC Integrates With Lutron QSX HomeWorks Processors
