URC Launches Networked Control

Written by Marco Attard

URC ships the MRX-10, a central hub for the company's newly launched Total Control series.

Mounting neatly on the main equipment racks, the MRX-10 stores and issues one-touch automation commands to all the client's IP, IR, RS-232, relay and sensor controlled devices-- allowing control of any kind of device, including those not carrying network technology.

Total Control remotes provide 2-way communications with the system, and installers can also link rooms and share sources.

One can expand the system through LAN and MRX-series sub-base stations, and it is programmable off premises via internet connection.
