Amber International makes orders and specification from the Forge Racking Solutions portfolio easier by providing installers with the Forge PC rack configurator, before launching new Forge rack offerings.

The configurator allows installers to virtually build rack setups to show customers before making any orders. The software features a step-by-step configuration wizard, front/side/rear views of created rack setups and various measuring and labeling capabilities.

Once finished installers can pass rack configurations straight to Amber for delivery.

The distributor also launches the Forge Stealth rack series-- a selection of durable racks attractive enough to be put in the middle of a room. While designed to stand alone, Amber says the racks can rest on casters or slide out from a wall, meaning installers do not need to compromise on placement.

The Stealth series ships with 20-44U contoured corner front and rear posts with numbered spaces, carries up to 680kg and ships flat packed in a black finish.

Also available is the Thin Line rack series-- floor standing and wall mounted racks only 458mm wide while still strong and wide enough to accommodate modern AV equipment.
